Joseph Zinter, PhD, Assistant Director and Lecturer,
Center for Engineering Innovation and Design (CEID)

Julia Jenjezwa, Yale student; Hiral Doshi, BS, Yale University Alumni; Catherine Jameson, BS, Yale University; Jason Brooks, BS, Yale University

“It is not what you look at, but what you see.”
Henry David Thoreau
but… we only find the world we look for…

“ We cannot create observers by saying 'observe', but by giving them the power and the means for this observation and these means are procured through education of the senses.”

Maria Montessori

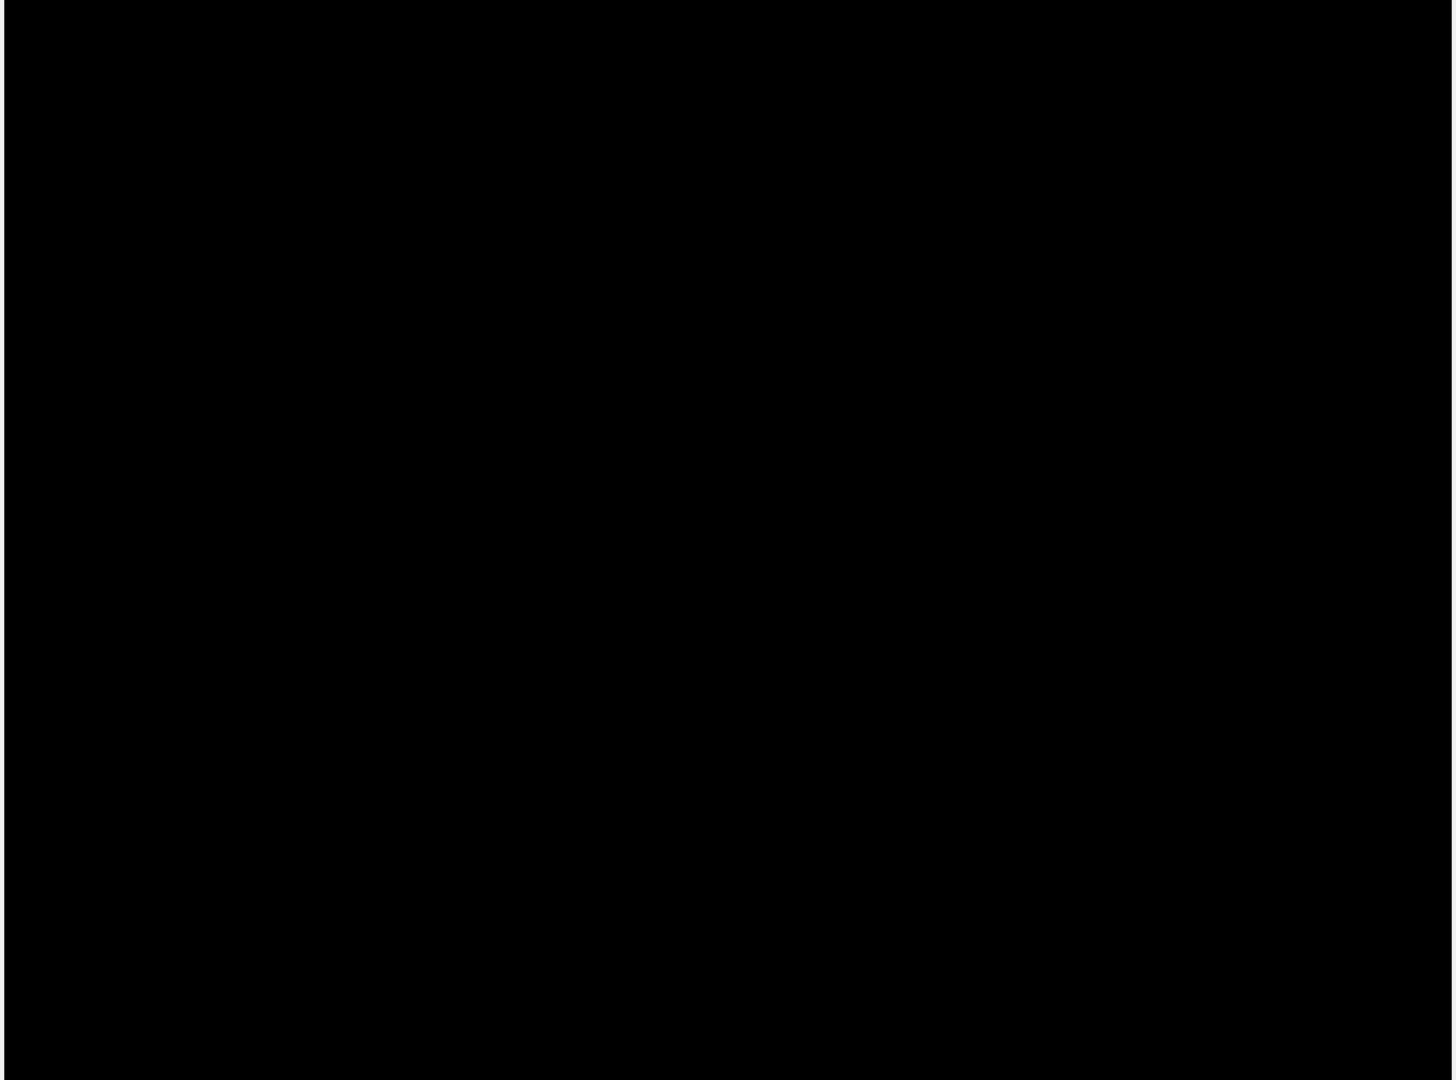
Development of perceptual skills is a critical yet complex skill that requires the effective organization and interpretation of data using visual, and auditory clinical observation.

Looking

- The art of diagnosis begins with seeing…
- “Never trust to general impressions, my boy, but concentrate yourself upon details.” Sherlock Holmes
- Details, details, details

WRITE DOWN WHAT YOU SEE

How many faces can you see ?



Looking

- The art of diagnosis begins with seeing…
- “Never trust to general impressions, my boy, but concentrate yourself upon details.” Sherlock Holmes
- Details, details, details

The process

The initial goal is not interpretations or analysis; rather it is verbalization of observations

- Do a visual inventory; what do you see?
- Do not jump to themes! Begin with objects, how many? Describe them. Color? Dress?
- No subjective statements- only objective. Describe, describe, describe…
- Unpack the picture- do all four corners

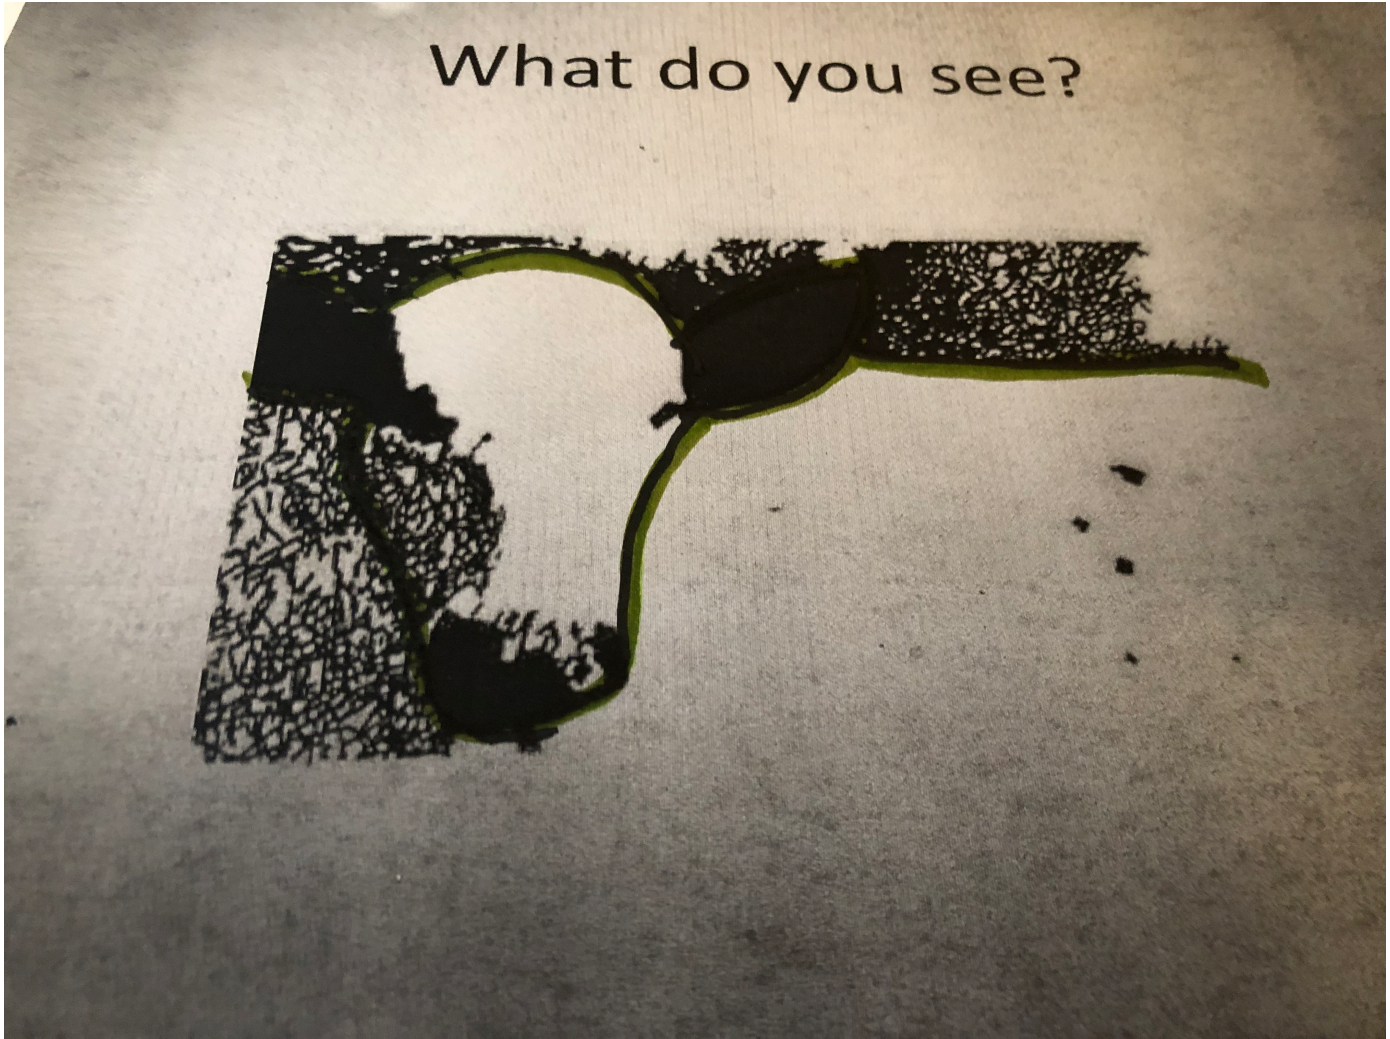
Now, stretch…

- Once you have done a visual inventory, note manner and mood in the painting, where is the light coming from (if appropriate)?
- Look at posture, body language- what do they convey to you?
- Themes- cluster the observations that relate to themes
- There are no right answers
- This is a level playing field

The experience…

What do you see?

What do you see?



What do you see?

The study

- Students who attended the looking is not seeing experience had significantly more written observations on the patient photographs on all but one photograph

	Number of Words		
Picture	Control	Museum	p-value
1	42	68	.0001*
2	45	56	.0196*
3	46	56	.0155*
4	55	57	.6676*
5	36	51	.0003*~
6	47	63	.0003*

	Number of Pt Objectives		
Pictur e	Control	Museum	p-value
1	10	14	.0001**
2	13	16	.0137**
3	12	16	.0001*
4	16	18	.0754*
5	9	11	.0004*~
6	15	18	.0063*

- The written words resulted in significantly more objective clinical findings on five out of six photographs.

Number of alternative diagnoses

	Mean			
Picture	**Museum**	**Control**	**Wilcoxon**	**p-value**
1	1.9	1.5	1199	0.0218
2	2.1	1.4	916.5	0.0033
3	2.7	1.7	807	0.0002
4	1.8	1.6	984.5	0.2182
5	2.7	1.9	899	0.0216
6	3	1.9	1387	0.0002

What do this photograph fall out from all others??

- Because they all saw it before!!! However, when analyzing this photograph closer, the researcher noted that the experimental group noted three out of four observations of the disease COPD as compared to two by the control group. Therefore even on the previously viewed photograph, students in the experimental group "saw" more than the control group.

Picture four specifics		
Control	Museum	p-value
2	3	.0008**

The newest study

Students who participated in the *looking is not seeing* experience had significantly more written observations;

higher number of objective physical assessment findings;

more objective physical assessment findings on the patient photographs, and…

	Pre	Post	Wilcoxon Signed rank Test (P)
Variable	**Mean**	**Mean**	
Image 1 (arm DVT)			
Total word count	142.73	148.52	0.6023
Total number of observations	21.23	31.33	0.0003
Number of objective physical assessment findings	7.95	16.33	<.0001
Number of diagnoses	0.64	1.67	0.0006
Image 2 (COPD)			
Total word count	143.45	173.90	0.0097
Total number of observations	26.86	33.62	0.0186
Number of objective physical assessment findings	8.00	12.57	0.0003

Correct diagnosis based on assessment of signs

	Pre		Post	
Variable	**Correct**	**%**	**Correct**	**%**
Image 1 Correct Diagnosis of arm DVT	1	4.55	14	66.67
Image 2 Correct Diagnosis of COPD	14	63.64	19	90.48

Differential diagnosis

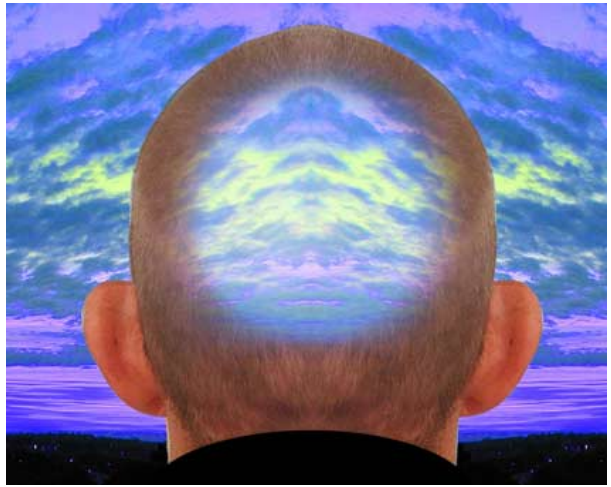
- **“Circumstantial evidence is a very tricky thing. It may seem to point very straight to one thing, but if you shift your own point of view a little, you may find it pointing in an equally uncompromising manner to something entirely different” Holmes**
- **Fluid, flexible seeing**

Lesson learned

- Slow down and observe
- The eyes don’t see what the mind does not know! Keep learning
- Everything including our learned biases influences what we see….
- You will only find what you look for…

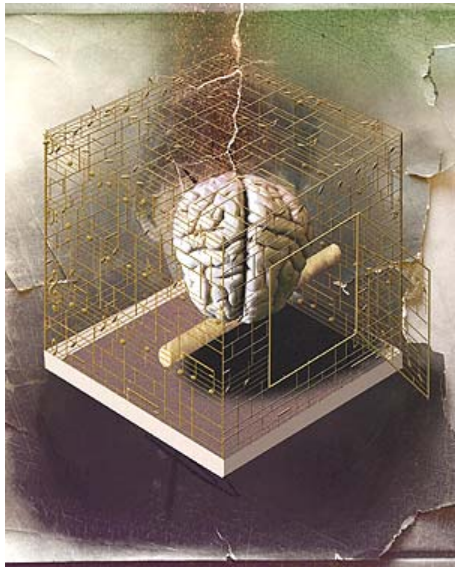
And so…

- Seeing is constructed, flexible and fluid. Observational skills can be enhanced with the use of art work and the experience translates into deeper seeing that results in enhanced diagnostic skills.



The extension…listening is not hearing

- The auditory arts were integrated with nursing science to develop curriculum for training students' listening skills in pitch, frequency, and discrimination

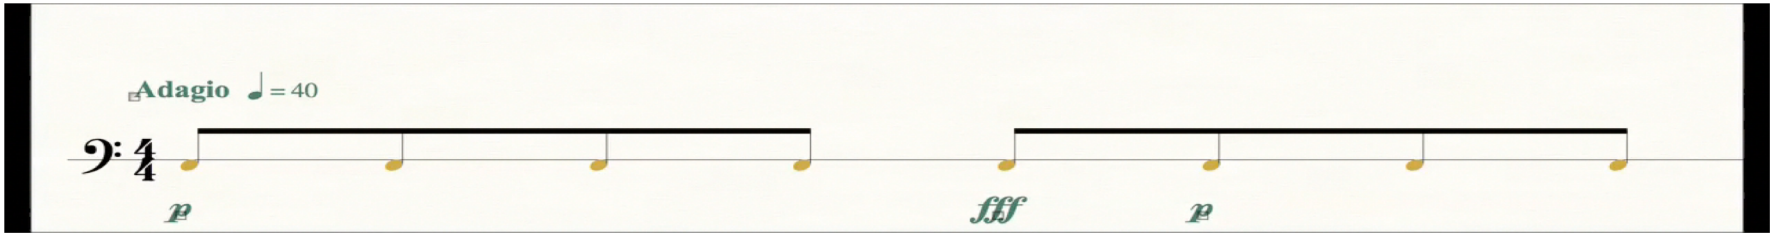


General Idea of Number in Sound

One beat is a unit of time. In a measure with 4 beats, beat one lasts from the point where it is first heard until the next beat is heard.

Dynamics

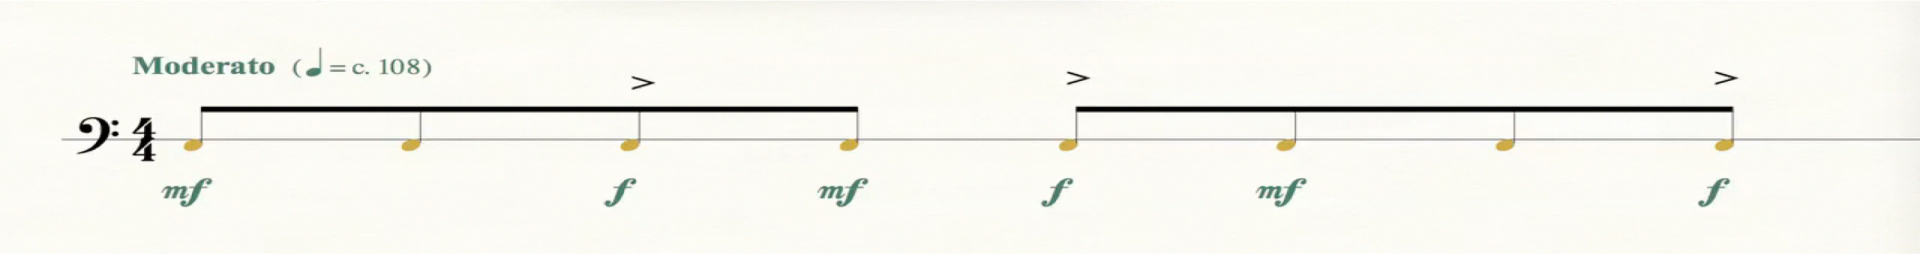
Beats can be played very loudly or very softly and everything in between. The volume of a sound is called its *dynamic*.



p = *piano* = soft
ppp = triple *piano* extremely soft
f = *forte* = loud (strong)
fff = *triple forte* = very loud

Accents

Some beats are stronger than others, they are “accented.”



Bowel Sounds

Count the bowel sounds over this 20 second sample and multiply by three for the "per minute" value.

00:00:00.000

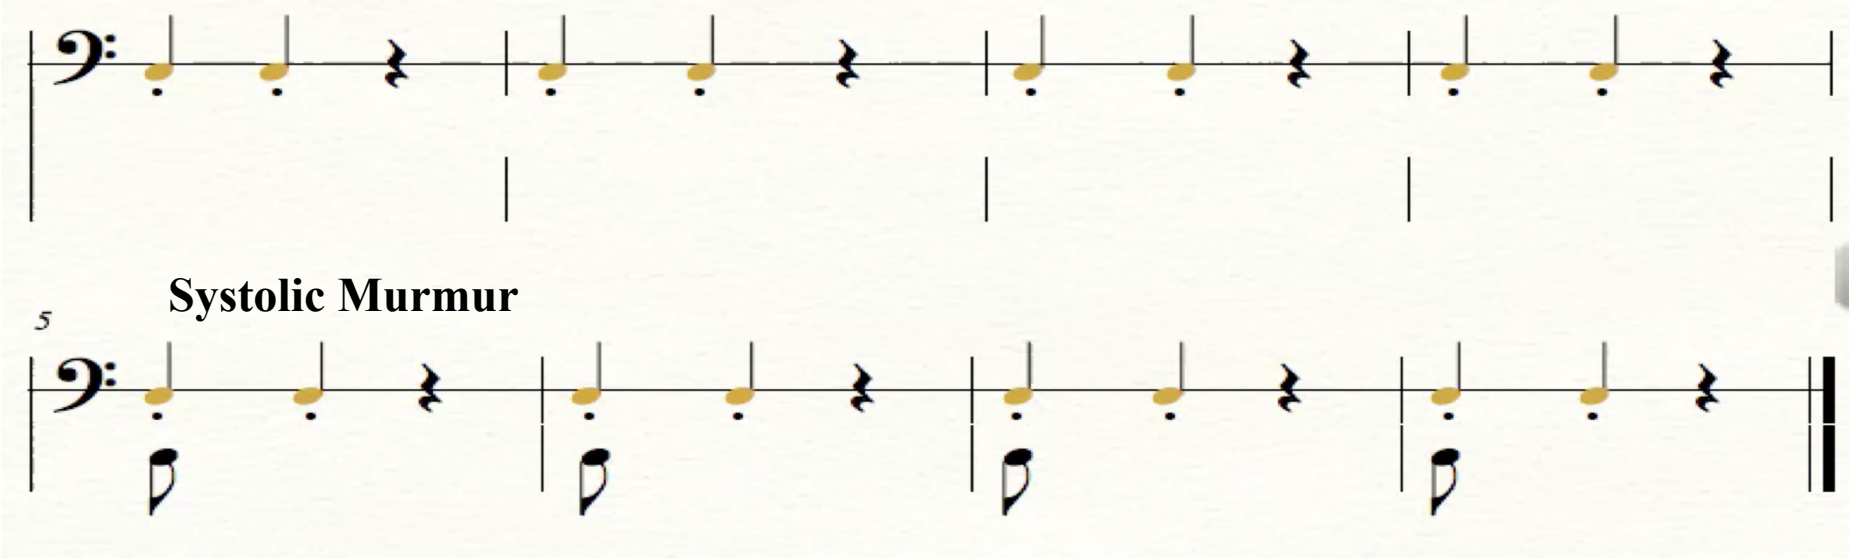
Bowel Sounds - Normal

Crackles

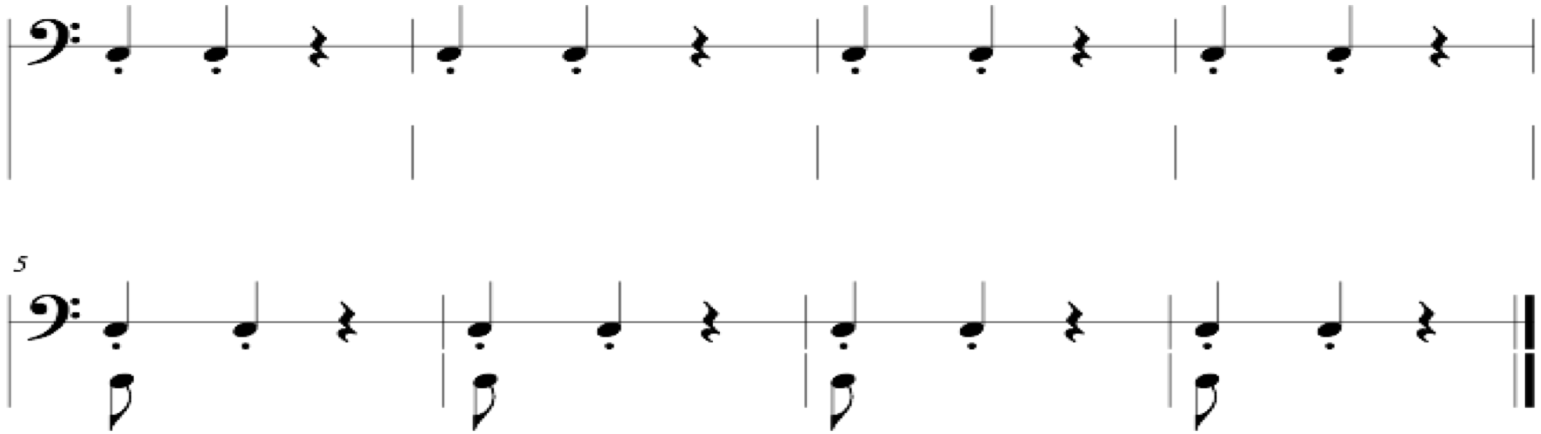
Real Lung Sounds: Crackles

Heart - Systolic Murmur
120 bpm

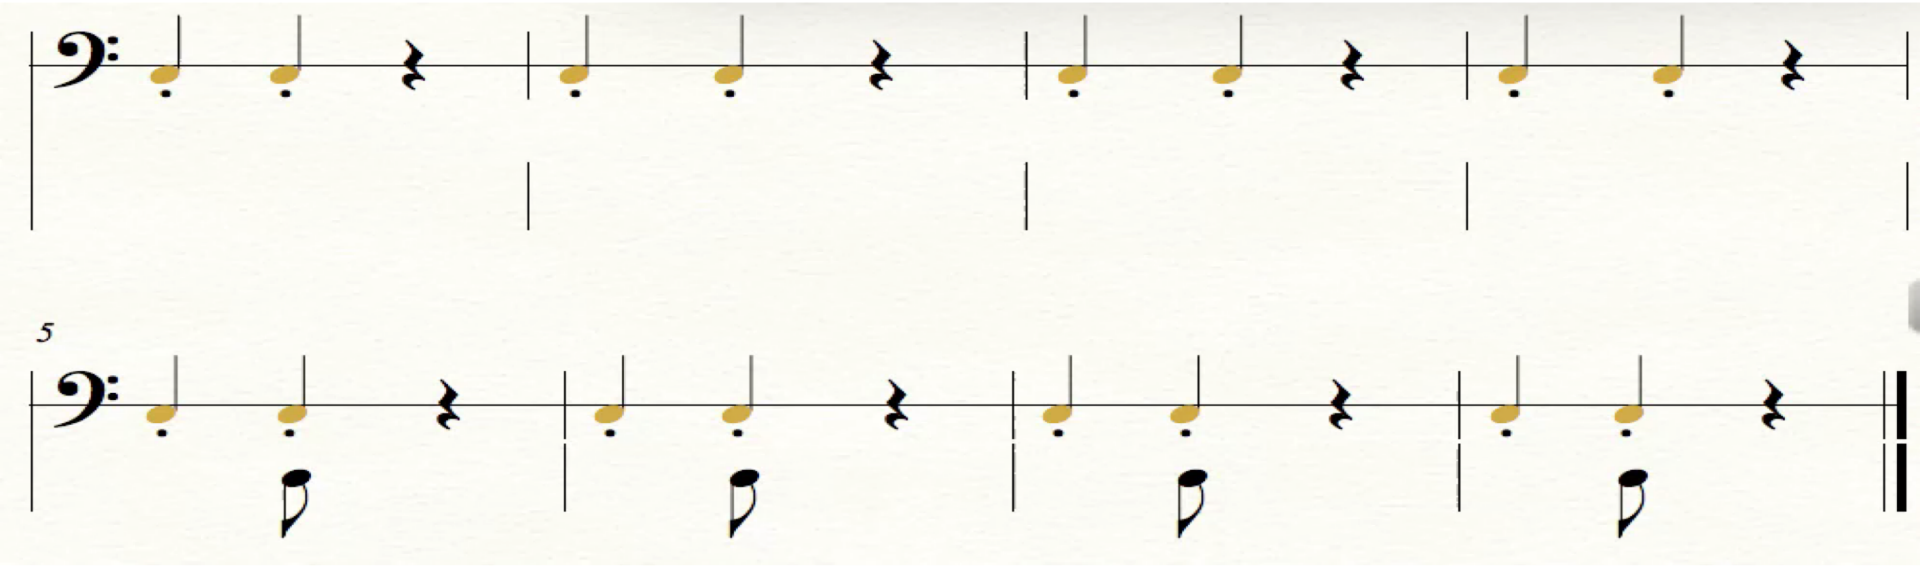
Middle



Real Heart - Systolic Murmur



Heart - Diastolic Murmur
120 bpm



Real Heart - Diastolic Murmur

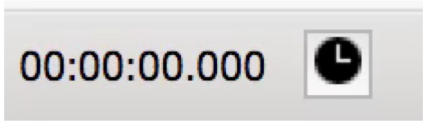
Masking Games.

What do you hear?

Example 1. WHAT DO YOU HEAR?



A. Normal bowel, normal lung + diastolic murmur?
B. Normal bowel, normal heart + wheeze?
C. Normal bowel + split S2 + friction rub?
D. Normal lung, normal heart, hyperactive bowel?

Masking Games.

What do you hear?

Example 1. WHAT DO YOU HEAR?

Answer: **All normal**

A. Normal bowel, normal lung + diastolic murmur?
B. Normal bowel, normal heart + wheeze?
C. Normal bowel + split S2 + friction rub?
D. Normal lung, normal heart, hyperactive bowel?

Masking Games.

What do you hear?

Example 1. WHAT DO YOU HEAR?

Answer: **All normal**

Post-test

Control Group

Control	N	Mean	Median	SD	Range
Heart sound score (N-10)	35	1.8	2	1.3	0.0 – 4.0

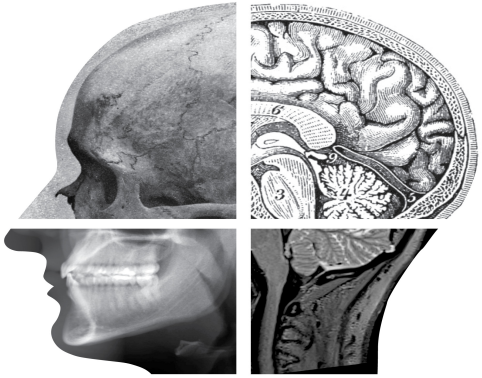
Touching Is Not Feeling

MEDICAL DEVICE
DESIGN & INNOVATION



An essential skill for clinicians is the effective organization and interpretation of data using tactile clinical observation. It is a complex skill that requires synthesis of anatomical knowledge, perceptive discrimination, and cognitive knowing.

The limitations of traditional methods for teaching include the variability of clinical preceptor's skills in helping students identify and name abnormalities, inconsistent exposure to important abnormal findings, and limited high fidelity simulator ability.

Pedal Pulsation

- Pedal pulses - pulses in the foot
- Allow clinicians to assess the blood supply to the lower limb
- EXTREMELY difficult to detect

CENTER FOR ENGINEERING
INNOVATION & DESIGN

The Trifecta…

Looking is not seeing….WORKS

Listening is not hearing….WORKS

Touching is not feeling….????

Innovation comes when a new set of eyes views your problems…

The future

The humanities are a valuable element of nursing education, yet the type of “humanities” has been constrained in nursing education. Our research reveals that arts and music bring a new lens through which students can learn valuable skills.

It’s your turn…
